Nucleic acids encoding a proto-oncogene tyrosine kinase, prevention, diagnosis and treatment of e.g. leukemia and useful for the lung tumors.

Claim 1; Fig 2A; 49pp; English.

The invention provides isolated nucleic acid sequences encoding a protooncogene tyrosine kinase (poTK). The poTK polynucleotides and protein may
be used in the prevention, diagnosis and treatment of diseases associated
with inappropriate poTK expression, such as lung and kidney tumours,
leukemia and stomach adenocarcinoma. poTK may be used to treat disorders
associated with decreased expression by rectifying mutations or deletions
in a patient's genome that affect the activity of poTK by expressing
inactive proteins or to supplement the patients own production of poTK.
The encoded poTK may be used as an antigen in the production of
antibodies against poTK and in assays to identify modulators of poTK
expression and activity. The anti-poTK antibodies and antagonists may be
used to down regulate expression and activity and as diagnostic agents

The invention relates to a newly isolated peptide sequence of a human CC kinase that is related to the proto-oncogene tyrosine kinase subfamily. CC The activity of the kinase of the invention may be described as, CC cytostatic, antiarteriosclerotic, antiinflammatory and antipsoriatic. CP peptides of the invention are useful in assays to determine the CC biological activity of the protein, in drug screening assays, tissue CC typing and pharmacogenomic analysis. They are also useful in treating or CC diagnosing disorders characterised by an absence of, inappropriate, or CC unwanted expression of the protein, such as inflammation, cancer (e.g. CC leukaemia, lung tumours, kidney tumours or stomach adenocarcinoma), CC arteriosclerosis, and psoriasis Nucleic acid molecules of the invention CC are useful as probes, primers and chemical intermediates in biological CC assays. The peptide and nucleic acid sequences are useful as models for the development of human therapeutic targets, aid in the identification of the development of human therapeutic targets, aid in the identification CC therapeutic proteins and serve as targets for the development of human therapeutic protein activity in cells and CC tissues that express the protein. The protein activity in cells and CC useful in gene therapy. The gene encoding the protein of the invention may also be useful in gene therapy. The gene encoding the protein of the invention may also CC represents the human kinase amino acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human kinase protein, useful for treating or diagnosing disorders associated with an absence of, inappropriate, or unwanted expression the protein, e.g. inflammation or cancer, in drug screening assays and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       kinase peptide or its allelic variant, orthologue or fragment. The peptide is useful for preparing a composition for treating a disease or condition mediated by a human kinase protein e.g. cancer. The present sequence represents the amino acid sequence of the human proto-oncogene

oncogene tyrosine kinase (poTK). The poTK polynucleotides and protein may
be used in the prevention, diagnosis and treatment of diseases associated
with inappropriate poTK expression, such as lung and kidney tumours,
leukenia and stomach adenocarcinoma. poTK may be used to treat disorders
associated with decreased expression by rectifying mutations or deletions
in a patient's genome that affect the activity of poTK by expressing
inactive proteins or to supplement the patients own production of poTK.
The encoded poTK may be used as an antigen in the production of
antibodies against poTK and in assays to identify modulators of poTK
expression and activity. The anti-poTK antibodies and antagonists may be
used to down regulate expression and activity and as diagnostic agents
for detecting the presence of poTK in samples. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           gene therapy; protein therapy; vaccine; enzymatic-inhibition; human; anti-kinase; oncogene; FES.

CC The invention relates to a newly isolated peptide sequence of a human CC kinase that is related to the proto-oncogene tyrosine kinase subfamily. CC The activity of the kinase of the invention may be described as, CC cytostatic, antiarteriosclerotic, antiinflammatory and antipsoriatic. CC Peptides of the invention are useful in assays to determine the CC biological activity of the protein, in drug screening assays, tissue CC typing and pharmacogenomic analysis. They are also useful in treating or CC unwanted expression of the protein, such as inflammation, cancer (e.g. CC leukaemia, lung tumours, kidney tumours or stomach adenocarcinoma). CC arteriosclerosis, and psoriasis. Nucleic acid molecules of the invention CC assays. The specide and nucleic acid sequences are useful as models for the development of human therapeutic targets, aid in the identification CC the development of human therapeutic targets, aid in the identification CC therapeutic proteins and serve as targets for the development of human therapeutic targets for the development of human therapeutic targets for the development of human consequence are useful and concent of the invention may also be useful in gene therapy. The gene encoding the protein of the invention for the invention may also be useful an amino acid sequence relative to the human kinase sequence of the invention. NOTE: This sequence is not further mentioned in the continuation the invention. NOTE: This sequence is not further mentioned in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

The peptide is useful for preparing a composition for treating a disease or condition mediated by a human kinase protein e.g. cancer. The present sequence represents the amino acid sequence of the human V-FES/FPS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New human kinase peptides, useful for preparing a composition treating a disease or condition mediated by human kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gan W,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             27-MAR-2001; 2001US-00817180.

vaccination, acids encoding a range of human polypeptides, useful in genetic therapy.

Claim 20; Page 645-646; 765pp; English

The invention relates to novel human secreted polypeptides. The colypeptides and antibodies to the polypeptides are useful for certaining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a thereactions of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins care useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell croliferation; as anti-inflammatory agents; and in bone, cartilage, tendon at alor nerve tissue growth or regeneration; immune suppression and/or extinulation; as anti-inflammatory agents; and in treatment of leukaemias. CC satimulation; as anti-inflammatory agents; and in treatment of leukaemias. CC secreted proteins of the invention

The present sequence represents the human kinase and phosphatase proceed (KPP), designated KPP-43. The human KPP sequences from the present invention have cytostatic, antiarteriosclerotic, anticonvulsant, neuroprotective, cerebroprotective, anti-HIV, antiallerg antiinflammatory and thyromimetic activities, and can be used in ge

The human KPP proteins and polynucleotides can be used in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of KPP, such as cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g. allergies) and developmental (e.g. Hypothyroidism, Cushing's Syndrome) disorders, or infections. They can also be used in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of KPP. The KPP or its fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polynucleotide and compounds that specifically bind to or modulate the activity of the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence

The proteins and their encoded genes are useful in gene therapy and regenerative medicine, e.g. by inducing neutralisation of mitochondria. They are also applicable in diagnosis, drug development for neural diseases and spulcable in diagnosis for generative medicine in diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Genes and proteins participating in neutralization of cells or tissues, useful in gene therapy and regeneration medicine, applicable in diagnosis, drug development for neural diseases and study of mechanism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Neuroprotective; neutralisation; CRAM; collapsing-response mediator protein-associated molecule; gene therapy; mitochondria; drug development; neural disease; pathosis.

```

The invention relates to novel human secreted polypeptides: The CC polypeptides and antibodies to the polypeptides are useful for CC determining the presence of or predisposition to a disease associated CC with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells CC expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or CC physiological interactions of the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins CC are useful in genetic vaccination, testing and therapy, and can be used CC as nutritional supplements. They may be used to increase stem cell composition to regulate haematopoissis; and in bone, cartilage, tendon CC and/or nerve tissue growth or regeneration; immune suppression and/or CC stimulation; as anti-inflammatory agents; and in treatment of leukaemias. CC AAU29510-AAU3304 represent the amino acid sequences of novel human creates.

AC AD The invention relates to a novel isolated polypeptide which is a human CC kinase and phosphatase (KPP). The polypeptide of the invention CC demonstrates cardiovascular, antiarteriosclerotic, hypotensive, CC vasotropic, antiinflammatory, antianginal, anti-HIV, antiallergic, antiatsthmatic, immunosuppressive, antithyroid, dermatological, antiatsthmatic, immunosuppressive, antithyroid, dermatological, antirheumatic, antiparatingout, gastrointestinal, neuroprotective, CC antiparkinsonian, mootropic, antigout, gastrointestinal, neuroprotective, CC antiparkinsonian, mootropic, antitonvulsant, hepatotropic, antipsoriatic, CC antiparkinsonian, mootropic, antilpaemic, antiparasitic, antiphemitic, antiparasitic,

The invention relates to a purified protein (I) that promotes type II collagen expression. Also disclosed is an isolated polynucleotide encoding (I), a recombinant vector comprising the polynucleotide and a gene therapeutic agent comprising the recombinant vector as an active ingredient. The proteins, genes, agents and methods are useful for preventing and treating a cartilage disease, e.g. osteoarthritis, cartilage defect, or rheumatoid arthritis. The current sequence represents a human protein that promotes type II collagen expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a purified protein (I) that promotes type II collagen expression. Also disclosed is an isolated polynucleotide encoding (I), a recombinant vector comprising the polynucleotide and a gene therapeutic agent comprising the recombinant vector as an active ingredient. The proteins, genes, agents and methods are useful for preventing and treating a cartilage disease, e.g. osteoarthritis, cartilage defect, or rheumatoid arthritis. The current sequence represents a human protein that promotes type II collagen expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Osteopathic; antiinflammatory; antirheumatic; antiarthritic; gene therapy; type II collagen; expression; cartilage disease; osteoarthritis; cartilage defect; rheumatoid arthritis; human.

Positions in the alignment are assigned to the surface or inside of the folded structure, active sites, and parsing segments. Secondary structural units are assigned by identifying periodicity in the assignments, and assembled into globular form using distance constraints imposed by disulfide bridges, active site assignments and co-variation analysis. The predicted secondary structures are useful for identifying antigenic sites on a protein molecule, as guides for site directed mutagenesis studies, and for understanding the interaction of a protein with other molecules
   Predicting the folded structure of proteins
                                                                                                                                                                                                                                                                                                                                  25-MAR-1992;
                                                                                                                                                                                                                                                                                                                                                                                                  28-SEP-1999.

Sequences AAY43902-Y44015 represent proteins used in a novel method of predicting the folded structure of proteins, by aligning sequences of homologous proteins and using patterns of evolutionarily conserved and varied sequences to assign positions. Positions in the alignment are assigned to the surface or inside of the folded structure, active sites, and parsing segments. Secondary structural units are assigned by identifying periodicity in the assignments, and assembled into globular form using distance constraints imposed by disulfide bridges, active site assignments and co-variation analysis. The predicted secondary structures are useful for identifying antigenic sites on a protein molecule, as guides for site directed mutagenesis studies, and for understanding the interaction of a protein with other molecules. (Updated on 17-OCT-2003 to standardise OS field)

GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: ISOLATED HUMAN KINASE PROTEINS, NUCLEIC
TITLE OF INVENTION: ISOLATED HUMAN KINASE PROTEINS, AND
TITLE OF INVENTION: ACID MOLECULES ENCODING HUMAN KINASE PROTEINS, AND
TITLE OF INVENTION: THEREOF
FILE REFERENCE: CLOOL183DIVI
CURRENT APPLICATION NUMBER: US/10/660,763
CURRENT APPLICATION NUMBER: US/10/660,763
CURRENT FILING DATE: 2003-09-12
NUMBER OF SEQ ID NOS: 4
SOFTWARE: FASTSEQ for Windows Version 4.0
SEQ ID NO 1
LENGTH: 2674
TYPE: DNA
ORGANISM: Homo Bapiens
